

Supervised Learning - Detailed

Concept

Supervised learning uses labeled datasets to train models.

The goal is to map inputs to outputs accurately.

- 1 Requires labeled data
- 2 Used for prediction tasks

Algorithms

Various algorithms are used depending on the problem type.

- 1 Linear Regression
- 2 Logistic Regression
- 3 Decision Trees
- 4 SVM
- 5 Neural Networks

Use Cases

It is widely used in real-world applications.

- 1 Email spam classification
- 2 Stock price prediction
- 3 Medical diagnosis
