

Unsupervised Learning - Detailed

Concept

Unsupervised learning deals with unlabeled data.

It identifies hidden patterns or intrinsic structures in the data.

- 1 No labeled output
- 2 Exploratory analysis

Techniques

Different methods are used for discovering structure.

- 1 Clustering (K-means)
- 2 Hierarchical clustering
- 3 PCA

Applications

Used in various domains to analyze data.

- 1 Customer segmentation
- 2 Market basket analysis
- 3 Anomaly detection
